

Auditory Diary Interface

The auditory diary will bind text entries to clock time on the X axis and date on the Y axis. The font fill color will encode qualitative values according to four values: “heard,” “listened,” “read” and “recorded.” The data will require filtering by time, date and qualitative value. The default view shows diary entries on a vertical timeline encoded by color. It is assumed the viewer will have a modern browser with internet connectivity, the ability to read English, and not be overly colorblind.
